

## Term 2 Week 4 Progress

- Completed first version of product
  - Has a complete workflow from inputting an initial design brief, to receiving a product idea with a description and justification
  - Outputs from all steps are currently saved as text files
  - Features that could be added from here (ranked by priority, first highest priority):
    - Refined prompts
    - Option to take human input instead of GPT response at each step
    - GUI (streamlet)
  - I've also sent over a pdf with a trial run using a design brief, with outputs from MetaGPT with GPT4, MetaGPT with GPT3.5, and normal web browser GPT 4
    - I would say the idea suggested by MetaGPT with GPT4 is superior to the one suggested by the browser GPT. The browser GPT idea could never be doable given the budget and timeframe of the design brief
- Talked to flatmate about getting design students for the evaluation. He's been busy but tomorrow he's going to ask the head of the design course if they could potentially complete a brief as a warmup exercise at the start of the day.
  - If this works would be perfect, if not he thinks he could get 3-5 people to agree to do it
  - The design task they got given by a private company I mentioned before got changed to a sketching competition, so that idea is no longer an option.
- Question: For what I actually want the design students to fill in, I was thinking I could leave it fairly open ended like it is in the trial. They would just have to fill in three sections:
  - Product Name:
  - Product Description:
  - Product Justification:
- Should I make something more specific?
